

JUNG

The JUNG radio

With built-in listening pleasure

More than simply a radio

With the JUNG radio, you can experience pure listening pleasure inside your own four walls: high-quality tone and great loudspeaker dynamics are taken for granted in this elegant built-in device as well as the use of bass reflex enclosures for optimisation of the acoustics.

The frequency range of the JUNG radio is 87.5 – 108 MHz (USW), whereby the best reception quality is guaranteed with the integrated antenna. All the standard radio functions such as station scanning and automatic storing of the four stations with the strongest signal are of course also available.

The JUNG radio is capable however of much more: not only can it be used as a radio alarm clock via an external time switch but it can also be coupled to the room lighting via an extension input – thus when you switch the light on in the bathroom or kitchen, you also switch the news on. If required, the integrated sleep mode can also be activated. This ensures that the radio switches itself off automatically after 30 minutes.

Versatility of the ranges

Match the radio to the design ranges? This presents no problems thanks to the sophisticated JUNG modular system: the JUNG radio is available in numerous switch ranges for every interior design style – not only do the switches, sockets and the remaining elements of the electrical installation have a uniform design, the radio can also be integrated harmoniously into this total visual concept.

Flat, flatter – the JUNG radio in Flat Design

The JUNG radio in FD offers full performance with an extremely slim visual effect. The particularly flat design of this switch range in various materials and colours is persuasive – an extremely harmonious aura is achieved when it is mounted on the wall.

Flat Design

Simple installation ...

The installation of the JUNG radio is carried out simply in two flush-type boxes – thanks to the prewired and pre-assembled components, the installation does not require a great deal of time and effort and can be carried out quickly.

The JUNG radio can be switched on and off remotely via two different extension inputs. The coupling of the room lighting is carried out for example on the 230 V input of the power section. A time switch can also be connected to the potential-free input of the radio insert which enables the device to be switched on and off automatically. The JUNG radio can thus also be used as a radio alarm clock.

... and convenient operation

The operation of the JUNG radio is carried out simply and conveniently via the four large push-buttons which are assigned the functions "ON/OFF, sleep mode and station scan", "Volume", "Memory 1 and 2" and "Memory 3 and 4". The additional status LEDs in blue and red further optimise the handling of the device.

Simple installation – thanks to the prewired and preassembled components
